Southern California Edison Company's Tehachapi Renewable Transmission Project:
Energizing Segments 7 and 8A Electric Transmission Line

Dear resident / property owner,

Southern California Edison Company (SCE) has completed a portion of its Tehachapi Renewable Transmission Project (TRTP) in your area. TRTP will provide added capacity to strengthen SCE's electrical system and also deliver clean renewable energy to the region to help meet California's renewable energy goals.

Important update:

SCE's goal is to energize and enter into service a portion of TRTP's electric transmission line in your area by mid-November, 2016 (a 500 kilovolt line). This includes the following Segments and areas (please see map on opposite side):

- Segment 7 of the project, which begins in Duarte and travels south-west near Mesa Substation in Montebello/Monterey Park.
- Segment 8A of the project, which begins near Mesa Substation in Montebello/Monterey Park and travels east, ending at the Mira Loma Substation in Ontario.

Operation of this electric transmission line will include:

- Delivery of reliable electric power to SCE's service territory.
- Periodic maintenance of the electric transmission line and related structures, during which SCE vehicles and equipment may need to operate within the utility right-of-way corridor.

Throughout TRTP's development, SCE has worked closely with local officials, property owners, residents, businesses and others in efforts to provide helpful project updates, minimize potential impacts during construction and respond quickly to requests for information.

For more information, please call the project hotline at (877) 795-8787 or email us at TRTP@sce.com or visit www.sce.com/trtp.

Thank you.

The Tehachapi Renewable Transmission Project in Your Area
